

Mortgage Securitization System (MSS)

(A Complementary System of Rastin Banking)

Bijan Bidabad¹

Abstract

Purpose: This paper aims to define a new system to facilitate obtaining reliable collaterals and guarantees for financial activities from tangible assets through a new financial instrument of "Guarantee Certificates".

Design: This system makes it possible to securitize movable/immovable assets into negotiable papers lots namely "Guarantee Certificates". Each lot of these certificates can be used as guarantee or collateral for any guarantee-backed activity in banks or other activities.

Findings: Mortgage Securitization System (MSS) securitize tangible assets and provides necessary collaterals and guarantees to be used for different purposes. The operations are carried out through notary offices. This system, as a complementary system of Rastin Banking System, can also be executed as separately.

Research limitations: The system is novel and it is required to be more elaborated for further practical development and adjustment. We just deal with securitization of tangible assets in this paper, while it can also be extended to securitization of intangible assets as well, through new institution and rules.

Practical implications: Many properties and assets can be used as guarantee for observing obligations. The available ways for changing (especially large) properties into small guarantees are not easy and efficient. MSS was designed to break large assets into many guarantee (certificate) lots and to reduce the formalities of mortgaging and its transfer.

Social implications: This system provides reliance and security upon collaterals and conditions for fast claim-clearing and low formalities without time-consuming adjudication processes.

Originality/value: Complementary systems in Rastin Banking have been designed to solve prevailing problems of the banking and financial activities. MSS was designed to provide necessary arrangements for transforming assets into negotiable papers.

Article Type: Technical paper

Keywords: Rastin Banking, Mortgage, Securitization, Banking Operations, Collateral, Guarantee, Guarantee Certificate.

Introduction

Rastin Banking² is a new Islamic banking system which studies theoretical and empirical problems of banking activities and operations, and introduces legal and executive solutions

according to the latest scientific and technical findings in the fields. Each subsystem of Rastin Banking has been designed to remove specific problems of banking operations. Mortgage Securitization System (MSS) is designed to provide necessary arrangements for transforming assets into negotiable papers, namely, Guarantee Certificates.

Many properties and assets can be used as guarantee for observing obligations. The available ways for changing properties into guarantees are not so easy. MSS which works under the Rastin Banking System law and regulations was designed to fulfill this purpose. Issuance system of Guarantee Certificate by notaries is defined under the supervision of Documents and Properties Registration Organization.

Mortgage

Etymologically, mortgage means to be pledged or obliged in something and it is synonym to the word collateral. In other words, mortgage is pledging (mortgaging) some assets for obtaining loan until the repayment. In Islamic jurisprudence, mortgage is defined as a contract for reliance of the creditor to debt to the debtor³; moreover, the pledged asset is called "mortgaged" or beholden (*rahn* or *marhounah*) and the one who gives the asset as mortgage is called "mortgager/mortgagor" (*rahin*) and the receiver of this asset is called "mortgagee" (*mortahin*). For mortgage contract to be juristically correct, it needs the assertion of the mortgager and acceptance of the mortgagee. Other qualifications of these persons are similar to those necessary for other contracts, including maturity, insaneness, free decision and etc. In Civil Law⁴, mortgage⁵ is a contract according which the debtor gives some asset to the creditor as collateral. This contract is revocable for mortgagee and irrevocable for mortgager⁶. But this issue does not mean that other regulations of revocable contracts cover this contract; this is because mortgage contract is not cancelled by death, or insaneness of each party of the contract⁷. Mortgaging any movable and immovable asset is possible if it is a financial asset and has rational benefit. Accordingly, in compliance to juristic rules the following elements are to be observed in mortgage contracts⁸:

1. Existence of a debt, even if the debt is not created simultaneously with mortgage contract.
2. The mortgaged asset must be substance.
3. Taking the possession of the mortgaged asset is for a certain (short) period.
4. The term of the mortgage must not be stipulated in the contract.
5. Taking the possession of the mortgaged asset must be possible.
6. Transaction of the mortgaged asset must not have any legal prohibition; therefore, an endowment asset devoted to children cannot be mortgaged.

In addition to the above conditions:

7. The mortgaged asset must be substance and mortgaging a debt or a profit is null.
8. The mortgaged asset must be determined or defined.
9. The mortgaged asset must be transferable and legally nontransferable assets such as devoted assets (endowments) cannot be mortgaged.

Guarantee Certificate

New and innovative financial instrument such as Rastin Certificates are used in Rastin PLS⁹ Banking System. Guarantee Certificate is a named document which shows the guarantee of a certain amount of money and is issued by notary office upon mortgaged asset and if the obligation is not fulfilled, the owner must compensate it, otherwise, the mortgaged asset will be sold through auction and the claim of the acceptor will be settled.

Mortgage Securitization System (MSS)

By evaluating the value of the assets of the client with a margin percent less, and deducting registration, auction, commission and other acceptable costs, notary office will issue Guarantee Certificates lots for certain period of time. The margin is determined by the Documents and Property Registration Organization. The owner of these certificates can offer their certificates as guarantees or collaterals to banks and other real persons or legal entities and institutions, on his own behalf (personally) or on one's own vice-behalf (representatively).

After fulfillment of his obligations, the owner of certificate will deliver his certificate back to the notary office and the notary will waive the lien or redeem the mortgaged. In case of unfulfillment of his obligations, the certificate acceptor (which can be the bank) can apply to notary and notary will sell the mortgaged through auction and give the value of certificate or make the property at possession of the acceptor after deducting commission and other costs from the owner of the certificate and update the related information in Collateral Registration System (CRS)¹⁰. If the acceptor of the Guarantee Certificate is a bank, bank can obtain its claims through Interbank Withdrawal Protocol (IWP)¹¹ from the account of the owner of the certificate, and return him the related certificate back, and then, if the owner were not accessible, bank will return the certificate back to the notary. The operation settles through Non-Usury Scripless Security Settlement System (NSSSS)¹² and simultaneous registration in CRS. In addition, if the acceptor of the Guaranty

⁹ The Rastin Profit and Loss Sharing (PLS) banking system was designed to increase the economic participation of banks and practicability of participation of real and legal entities (private or public) in investment and financial activities and also to increase the efficiency of monetary intermediary and better absorption and allocation of financial resources. See:

Detailed design of Profit and Loss Sharing (PLS) banking. Office of Research and Planning, Bank Melli Iran. 2008, Tehran. <http://www.bidabad.ir/doc/detailed-pls.pdf>

¹⁰ It is seen much that loan applicant has used his assets as mortgage in several banks. The Collateral Registration System (CRS) has been designed to prevent such an action. This system is an integrated database and has capability of data entry for online registering movable/realty collaterals information, and is accessible for banks, legal authorities and other applicants to get information about the mortgaged assets. ¹¹ It is seen much that a person owes lot to one or several banks but he has deposits at other banks. The Interbank Withdrawal Protocol (IWP) is an agreement between banks and under the supervision of central bank which allows banks to withdraw money from the accounts of the debtor at other banks after depleting the money in the account of the debtor at the agent bank through online operation. See:

¹² Non-Usury Scripless Security Settlement System (NSSSS) is an integrated web-based system for settlement of Rastin usury-free certificate transaction under the supervision of central bank. The NSSSS operations is conducted under the law and regulations of Rastin Banking Law and its Executive Regulations. See:

Certificate is a bank and the debtor accounts is not enough to compensate the debt, bank can clear his claim through “Bank Documents Execution Unit” (BDEU)¹³ for enforcement of the purport of the documents.

Moreover, movable assets which are imperishable and can be used in a foreseeable period can be used as mortgage. Immovable (realty) assets used as mortgage must (site and superstructure) entirely and legally be registered, easily negotiable and must be confirmed through municipality and other relevant authorities that it is not located in urban development plans. The immovable asset with a devotional land (endowment) can be mortgaged only when the owner has separate ownership document for the building itself and has a permission for mortgaging the building from the devotee for a long enough period of time. Mortgage asset (site and superstructure) should entirely and legally be registered, easily negotiable, and the ownership of the asset should be proved before mortgage transaction.

At the beginning, the owner applies necessary documents to notary and requests for appraisal of the property and issuance of Guarantee Certificate. After appraisal of the property by Ministry of Justice official expert, the notary will mortgage the property and issue Guarantee Certificate with a value lower than the assessed value. All ownership documents will be deposited at the notary. The property is assessed according to market price by Ministry of Justice official expert. The margin amount deducted from the assessed value for mortgage transaction is equal to the total registration, auction, commission and other acceptable costs. This amount is defined by Documents and Properties Registration Organization. The notary receives registration and writing fees for issuing Guarantee Certificate.

Notary mortgages the property and instead, issues Guarantee Certificate for the property owner. Notary can divide Guarantee Certificate into several lots according to the request of the owner. Each lot of Guarantee Certificate represents a specific amount of guarantee independently. Each lot of certificate should have a separate serial number. All Guarantee Certificate operations should be registered in CRS system. The certificates will be registered according to their serial numbers in CRS and can be traced according to its serial number or other identifications related to property or its owner.

Whenever the certificate owner deposits the certificate as guarantee to a person, he has to fill a written form with the signature of the owner as well as the acceptor of the certificate to the issuing notary and the notary register the action in a special registry book and in CRS. The acceptor of the Guarantee Certificate must inquire the validity of the certificate from the issuer notary or from CRS site. The issuer notary is obliged to inform the acceptor about the certificate condition within 2 days.

All real persons and legal entities (public or private) and those affiliated to government can apply to notary for mortgaging their properties and requesting Guarantee Certificate. Banks as well as other persons can accept Guarantee Certificates as guarantee or collateral. In order to compensate

the probable losses to property, bank can ask the owner to insure the mortgaged for the bank through any insurance company that bank confirms its insurance service.

Guarantee Certificates in Rastin PLS banking and its subsystems are not considered as contribution of the entrepreneur and is only accepted as guarantee and collateral, and are not negotiable at Rastin Certificate Market (RCM)¹⁴; but, the owner of Guarantee Certificates can negotiate their certificates or use them as guarantee in other markets. All benefits of the mortgaged asset during mortgage duration belong to the owner of property.

Guarantee Certificates do not have due date and is valid until the owner returns it back to the issuing notary. If the owner of the Guarantee Certificate could not fulfill his obligations and the mortgaged asset is not dividable, the asset will be sold at an auction and the remainder of the amount sold will be deposited at Documents and Properties Registration Organization. Moreover, after selling the mortgaged asset, notary can compensate registration, auction, commission and other acceptable costs from the amount of sale after paying back the claims of the Guarantee Certificate acceptor. If the acceptor is bank, bank can receive his claims due to Guarantee Certificate from the accounts of the certificate owner through IWP at maturity and delivers the certificate to certificate owner or in the case that certificate owner is not accessible delivers the certificate to issuing notary. After receiving the Guarantee Certificate when the debtor cannot fulfill his obligations, the notary has to execute the concluding activities within 10 days. Whenever the Guarantee Certificate is freed, it should be informed to the notary in written and be registered in registry book and in CRS.

Documents and Property Registration Organization needs to compile necessary instructions and regulations for notary operations due to MSS operations and will supervise the process. Mortgage Securitization System is carried out under the law and regulations of Rastin Banking Law and its Executive Bylaw.

This system provides the reliance and security upon collaterals and conditions for clearing the claims with low formalities and time consuming and does not need to plead to legal authorities which are usually time-consuming processes.
